Bio Corporation has a wide variety of preserved specimens, from a tiny spider to a large shark. Cover your lab for mammals with dissection of fetal pigs, mink, rabbits, rats or cats. You can select a plain preserved or an injected specimen. Injected specimens will highlight the different arteries and veins. Most of the specimens are of good size for the species. Need a specimen for marine biology? We have sting ray, anemone, sea cucumbers, horseshoe crabs, squid, jelly fish, sharks and more. The sharks will be the only marine specimen that will have injections.

Worms, frogs and owl pellets, best sellers for middle schools. These specimens are of good size but not too large to overwhelm students. Even for their size the dissection is fascinating.

Study on larger organs for anatomy. Organs are obtained from full size animals.

Cow hearts are amazing! Bio Corporation carries organs from cow, pig, sheep and turkey. Injected organs include the pig and cow kidneys and sheep hearts. Compare between the different specimens or compare a full size to an embryo size.
